

Automated Technologies Production of Preform

Aleksei Chesnokov

Head of the Laboratory of new ways of formation preform for composite materials, State Educational Institution of Higher Education Moscow Region, Korolev, Russia.

kompozit-ut.ru

Automated radial braiding machine RP64-1-130 with a split housing

- Contour weaving with high-strength and high-modulus threads.
- Contour weaving in two and three axial (with skeletal reinforcement) schemes.
- Contour weaving products with a straight and curved axis.
- Contour weaving products with a closed axis.
- Applying a coating layer with a continuous surface hiding.
- Applying the sheath layer to larger diameters with the formation of a mesh structure.
- Independent movement of the supports in the transverse direction and joint in the axial direction.

Modernization
RP64-1-130
increased the number of
controlled coordinates

- The support has a vertical rotation and a rotation of the mandrel.
- 5 program controlled coordinates.

Equipment RP64-1-130 manipulator with CNC KUKA KR-61

- 6 controlled coordinates.
- 60 kg loading capacity.

An example of modeling woven layers of triax reinforcement

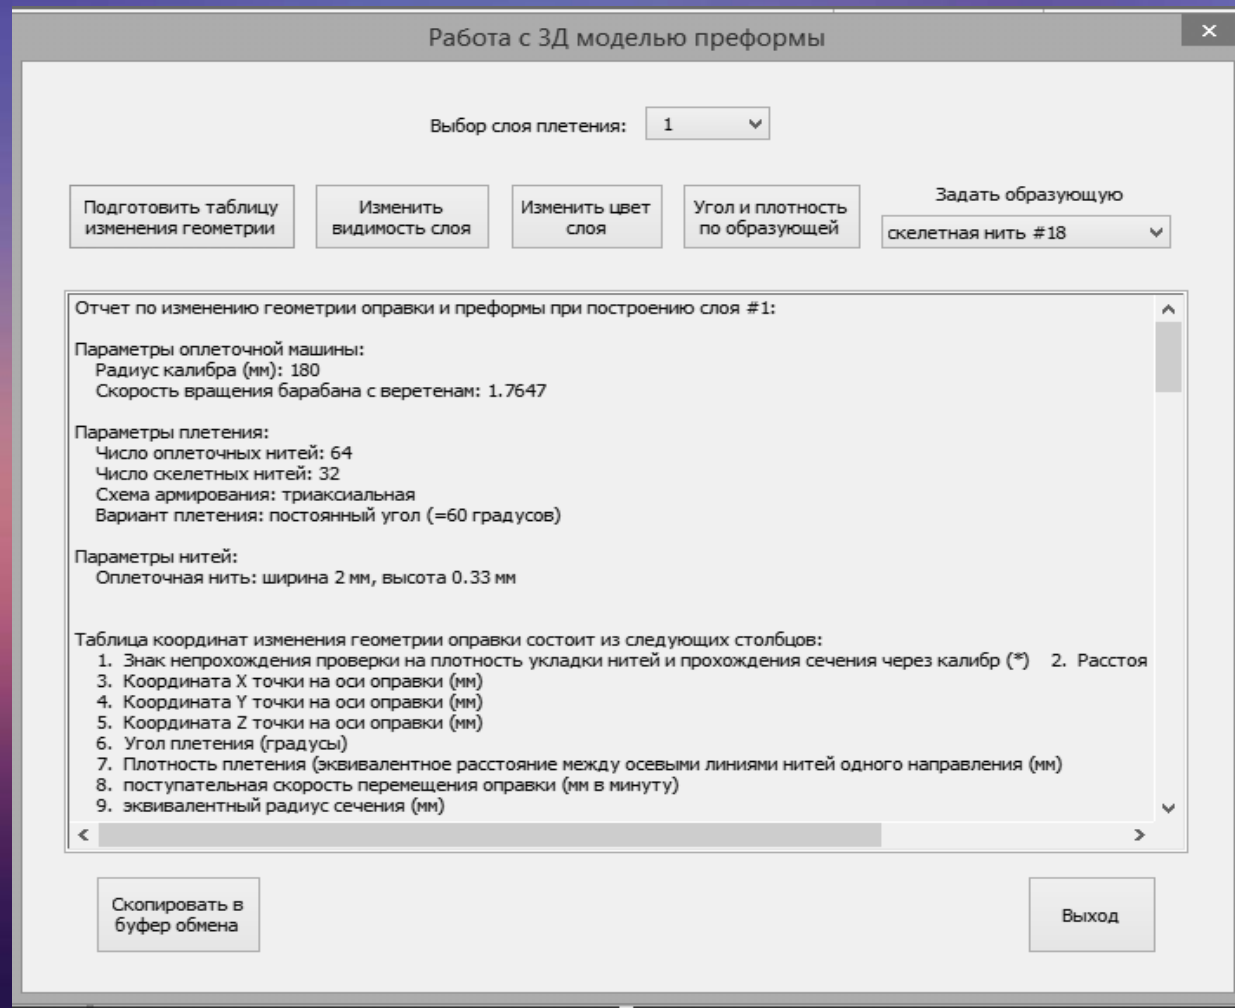

An example of modeling a woven layer on a complex preform

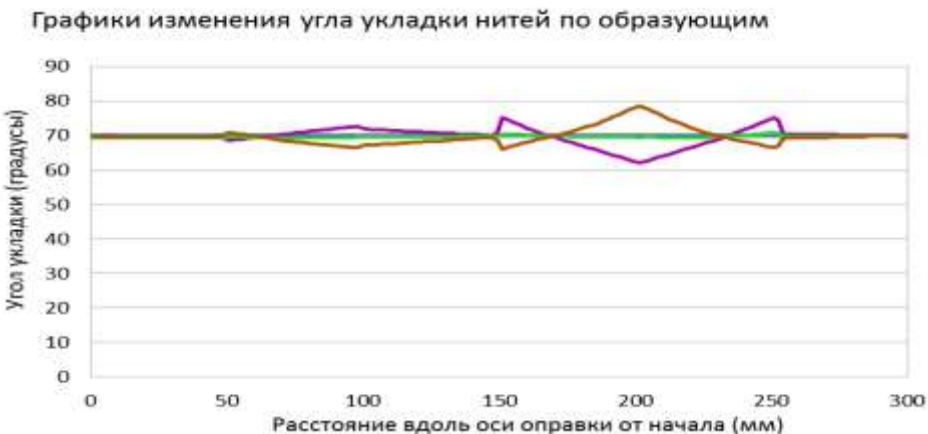

Preform Construction Results Dialog Box

Displays

- Equipment parameters.
- Weaving parameters.
- Thread options.
- Information for programming braiding equipment.
- Parameters of the resulting preform on the selected axes.

Graphs of parameters of the woven layer along the selected skeletal threads

Work is underway to develop an automated optical quality control system for manufacturing preforms — machine vision

Automated technology of diagonal weaving of preforms

Trajectories of motion and examples of the resulting preforms

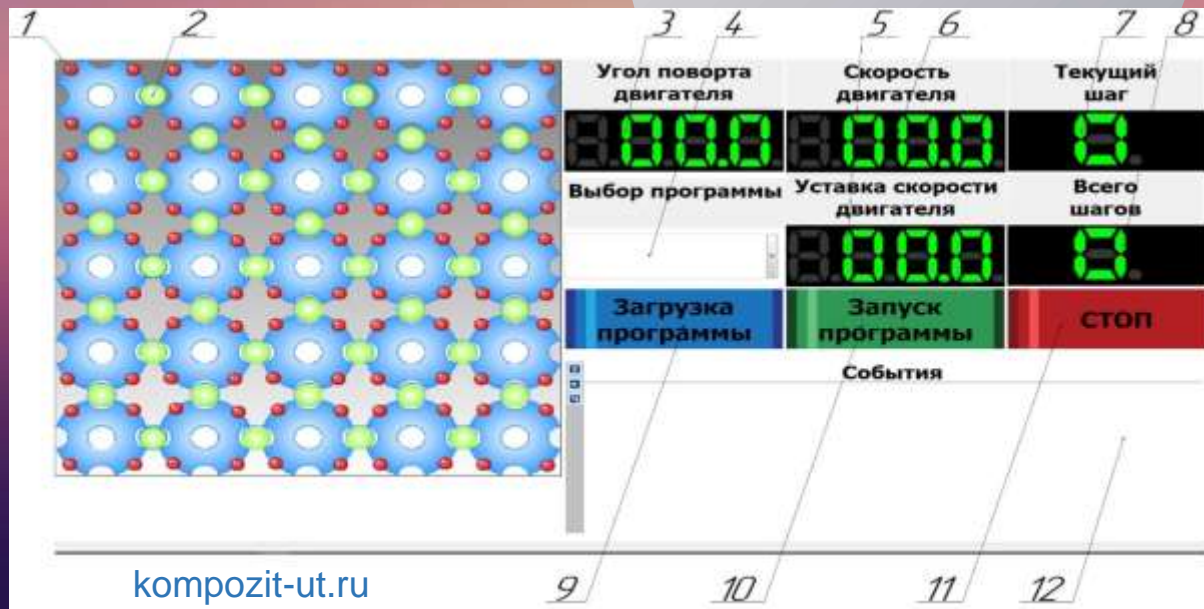

Equipment DP50-1-150 and the principle of weaving control

Control system DP50-1-150

Diagonal Weaving Software

Management program DP50-1-150

Automated technology of rotary weaving preforms

Element rotary installation

The system for setting the rotation and control of the spindle position

Practicing the principles of movement and control

Control system rotary installation

Braided patterns

Advantages of rotary weaving

- Increase in productivity by 5 and more times in comparison with diagonal weaving;
- No spindle impact;
- Possibilities of changing the shape of the preform cross section that are not limited by collisions of spindles.

Automated installation of reinforcement preforms

Settings for the assembly of reinforcing preforms

- Implemented reinforcement structures - 3D and 4D-L.
- Preform form - cylinder, cone, solid or with a hole.
- The diameter of the rod used - less than 1 mm.
- The number of independently controlled coordinates – 8.
- Increased productivity compared to manual assembly - more than 2 times.
- Rod diameter control using an Lsten optical contactless micrometer, relative error limit - 1 micron.
- Automatic documentation of the assembly process.

Installation software

- Pictorial mimics of snap-in management in preform assembly mode and debugging on the touchscreen monitor

Areas of cooperation

- Development of technology for manufacturing preforms for carbon-carbon and carbon-ceramic products according to customer requirements.
- Joint research of manufacturing technologies for preforms and products based on them.
- Development of equipment and software manufacturing preforms.
- Joint research on modeling preforms and their manufacturing process.
- Modeling the properties of products based on woven preforms.
- Joint research on the development of new preform manufacturing technologies.
